BALL VALVES

BALL VALVE MODEL SCHEDULE ILLUSTRATION

1. Codes of Nominal Diameter

British series indicated by Axx in value, and metric series indicated by Gxx mm value.

2. Codes of Driving Modes (For handle or lever drive, this code can be omitted.)

3 - Manual Operator; 6 - Pneumatic; 6S - Pneumatic Spring Return; 6A - Pneumatic Control;
5 - Bevel Gear Drive; 7 - Hydraulic; 8 - Airdraulic; 8H - Airdraulic with Emergency Cutoff;
9 - Electric

3. Codes of Valve Types

FB - Float Ball Valve; TB - Fixed Ball Valve

4. Codes of Nominal Pressure Class

1 - PN16 class 150; 2 - PN25; 3 - class 300; 4 - PN40 class 400; 6 - PN64 class 600;
9 - class 900; 10 - PN100; 15 - class 1500; 16 - PN160; 20 - PN200; 25 - class 2500

5. Codes of Connecting Modes

RF - Raised Face Flange; FF - Fully Flat Face Flange; MFM - Male and Female Flange; TG - Tongued and Grooved Flange;
RJ - Ring Joint Flange; BW - Butt Welding; SW - Socket Welding; NPT - Threaded Connection

6. Codes of Structural Modes

1 - Full Bore Straightway; 2 - Reducing Straightway; T - T-shaped Three-Way; 3L - L-shaped Three-Way; 4 - Four - Way;
5 - Overall Top Installed(Full Bore); 5A - Overall Top Installed(Reducing); 6 - Track Ball Valve(Full Bore);
6A - Track Ball Valve(Reducing); 7H - Eccentric Half Ball; 8 - All Welded(Full Bore); 8A - All Welded(Reducing)

7. Code of Casing Materials

C - WCB; C5 - CF; C6 - WC6; BL - LCB; CL - LCC;
8 - CF8; 8M - CF8M; 3 - CF3; 3M - CF3M; ML - MONEL

8. Code of Ball Materials

1 - WCB; 2 - CF8; 3 - CF8M; 4 - CF3; 5 - CF3M;
1F - A105; 2F - 304; 3F - 316; 4F - 304L; 5F - 316L

9. Codes of Seat Material

F - PTFE; N - Nylon; G - Carbon Fiber; P - PPL; E - PEEK; M - MOLON

Note: The letters of "K", "E", "O" and "J" are placed in front of the codes of valve types, respectively representing hydrogen sulphide resistant, extension bar, oxygen and jacketed ball valve.

Example: A8"TB3RF1C2F means API 8" worm gear drive, fixed ball, 300Lb, raised face flange, full bore, body material WCB, ball material CF8 and seat of F4.

*The figures mentioned hereunder don't have the codes of caliber and valve material, they are to be specified by users.

Technical Specification

Technical Specification	API
Design Specification	API6D, API608, BS5351
Pressure and Temperature Class	ASME B16.34
Face - to - face	ASME B16.10
Flange Type and Dimensions	ASME B16.5, ASME B16.47
Butt Welded	ASME B16.25
Socket Welded	ASME B16.11
Threaded	ASME B16.1.20
Inspection and Test	API598, API6D

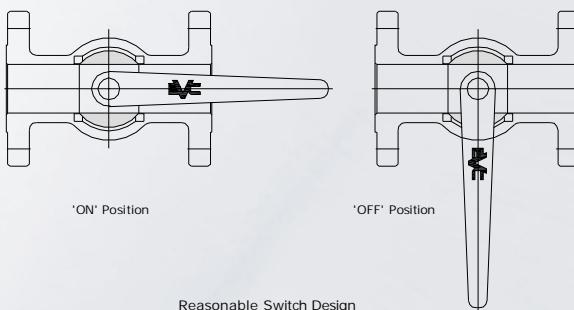

FLOATING BALL VALVE

Structural Features

Floating ball valves are superior products developed upon the advance technology home and abroad. Provided with updated design general industrial standards.

1. Switch Indication of Hand Operated Floating Ball Valve

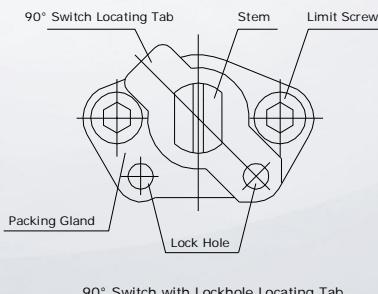

As the moving parts of valve, ball, valve stem and handle are an assembly unit. The head of valve stem is shaped a diploid, thus to easily distinguish whether valve is in the 'ON' position or 'OFF' position from handle position. When handle or stem diploid is in parallel with the pipe axis, valve is 'ON' position, when handle or stem diploid is vertical to the pipe axis, valve is in 'OFF' position.

Reasonable Switch Design

2. Hand Operating Ball Valve

To prevent misoperation, the fully opened or closed position of valve can be locked, especially when valves are mounted outdoors or when valves are not allowed to be opened or closed by technical process. To prevent misoperation by other persons, it is very important to have valve position locked. Thereby, lockhole locating tab is designed if requested by users to meet the technical requirement of users.

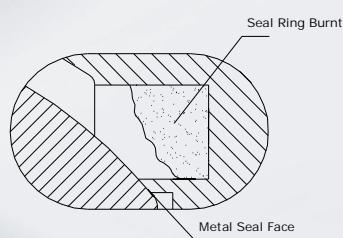

90° Switch with Lockhole Locating Tab

3. Anti Blow Out Stem

When medium passes through the valve, the pressure in valve body may possibly push the stem out, or when the valve is in repair, if there is pressure in the middle cavity, which can cause injuries to human being. To prevent this possibilities, a dummy club is placed at the lower part of the stem. In this way, even if there is fire, packing and thrust bearing are burnt or packing is damaged due to other causes, the pressure of medium in valve body will make the dummy club of valve stem in close contact with the upper seal face of valve body, thus to prevent medium leaking out from the damaged packing position.

4. Anti Static Device

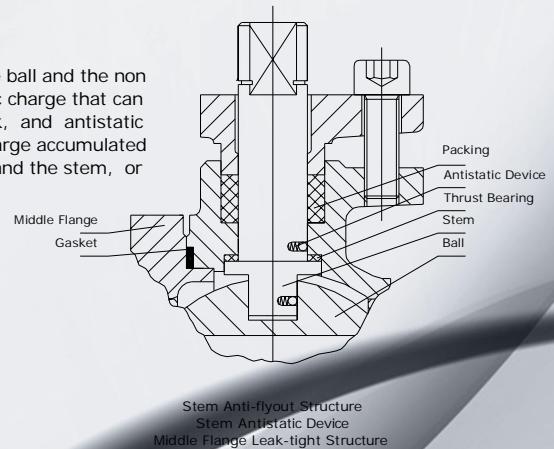

When operating the valve, the friction between the ball and the non metal seat, like PTFE or etc, will produce electrostatic charge that can be accumulated on the ball. To prevent static spark, and antistatic device is placed on the valve to derive the electric charge accumulated on the ball from the static channel between the ball and the stem, or between the stem and valve body.

5. Firesafe

Fire Protection Structure of Float Ball Valve

In case of fire, the nonmetal packing or seat (non-fireproof material) will be burned, the considerable medium leakage may possibly cause fire spread. Here, the fire protection structure functions to prevent medium from mass leakage. As shown in the figure, once the seat is burnt, the ball will directly contact the metal face on valve body, thus to prevent medium leaking out from the burnt seat. The design of fire protection and antistatic structure shall conform to the requirement of API607, JB/T6899 and the second part of BS 6755.

Stem Anti-flyout Structure
Stem Antistatic Device
Middle Flange Leak-tight Structure

BALL VALVES

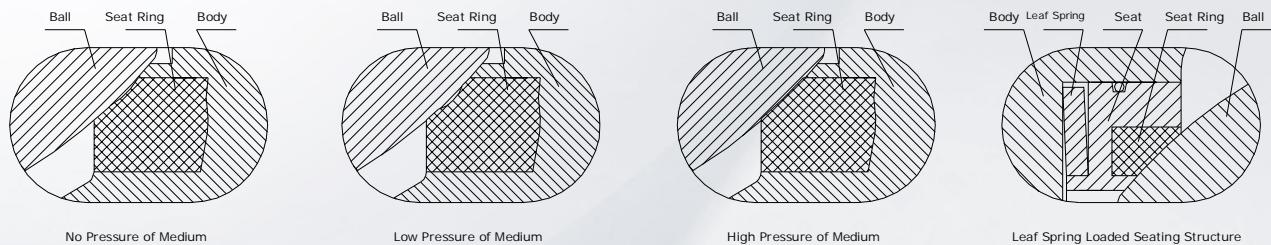

Structural Features

Dependable Seating Structure

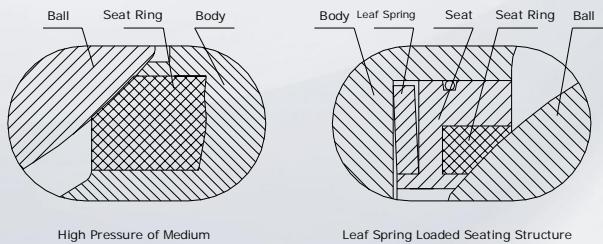

The two-way sealing structure embodying the years of our manufacturing experience in ball valves and the internationally advanced technology can release the pressure at valve seat and ensure reliable seal under high or low pressure and vacuum state. When the pressure of medium is low, the contact area between valve seat insert and ball is relatively small, thus providing high sealing load to ensure dependable seating seal. When the pressure of medium is high, the contact area between valve seat insert and ball is relatively large, so that the valve seat insert can endure the considerable medium thrust and cannot be damaged.

Regarding ball valves of very low working pressure, in consideration that the pressure of medium cannot guarantee the dependable seal of valve seat, and that the pretightening force will decrease after a long time of service, so we apply leaf spring loaded seating structure for valves working under low and ultralow pressure or under vacuum conditions, thus to ensure persistent and dependable seal.

The seating structure of medium and high temperature ball valves use PPL for seal ring that can serve a temperature of 300°C. Ball valves with metal seal and high temperature resisting materials can be used to deal with even higher temperature. This structure takes the function of one-way seal.

Double Bevel Elastic Seal Ring of Float Ball Valve

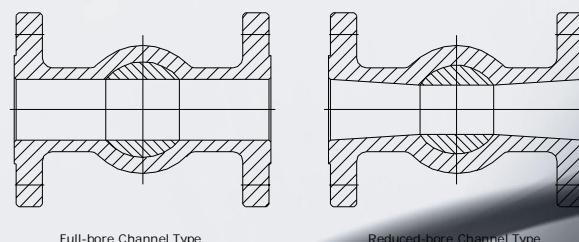

Self-releasing Structure

In case of abnormal rise of pressure in the middle cavity of valve resulted from the medium left there suffered from changes of pipeline pressure or medium temperature, automatic pressure relief of valve seat can be affected under the pressure of the medium itself, thus to guarantee the safety of valve.

Full and Reduced Bore

We have ball valves of full and reduced bore to meet users' different needs. Full-bore ball valves have the same inside diameter as that of pipeline, with the lowest fluid resistance for the convenience of cleaning the pipeline. While reduced-bore ball valves weighs only 70% of full-bore valve with the same calibre, a saver of cost and price, and its fluid resistance coefficient is only 1/7 of that of the globe valve with the same caliber, so that reduced-bore ball valves are widely used abroad.

FLOATING BALL VALVE
